Salmon Stream Temperature Fact Sheet

Bodenburg Creek

Cook Inletkeeper coordinates a Stream Temperature Monitoring Network across key salmon-bearing systems of the Cook Inlet basin. Our goal is to describe water temperature profiles and identify watershed characteristics that make specific streams more sensitive to climate change impacts. This fact sheet provides a summary of data collected on Bodenburg Creek through this collaborative effort.

Why temperature?
Water temperature affects all phases of the salmon lifecycle, including:
* timing of migration
* survivorship of eggs
* respiration
* metabolism
* availability of O₂

Warm water temperature induces stress in salmon and makes them more vulnerable to pollution, predation and disease.

Watershed facts
Bodenburg Creek watershed (highlighted in green on map) is located in the Mat-Su basin. The creek is predominately spring-fed and flows by the community of Butte and into the Knik River.

- Watershed size: 2,770 acres
- Maximum elevation: 345 feet
- Mean elevation: 95 feet
- Percent wetlands: 5.1%
- Connected lakes: No

Water temperature monitoring site is located downstream of mile 10 of the Old Glenn Highway.
Latitude (N) 61.51722; Longitude (W) -149.04233
### Bodenburg Creek Temperature Summary

Below is a summary of Bodenburg Creek water temperature data from 2009-2012.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum temperature recorded</td>
<td>9.1°C (48.4°F)</td>
</tr>
<tr>
<td>June average temperature</td>
<td>5.1°C (41.2°F)</td>
</tr>
<tr>
<td>July average temperature</td>
<td>5.2°C (41.4°F)</td>
</tr>
<tr>
<td>August average temperature</td>
<td>5.1°C (41.2°F)</td>
</tr>
<tr>
<td>Maximum 7-day average temperature</td>
<td>5.5°C (41.9°F)</td>
</tr>
<tr>
<td>Maximum 7-day maximum temperature</td>
<td>6.6°C (43.9°F)</td>
</tr>
<tr>
<td># of days/year temperature exceeds 13°C (55°F)</td>
<td>0</td>
</tr>
<tr>
<td># of days/year temperature exceeds 15°C (59°F)</td>
<td>0</td>

</tbody>
</table>

### Climate Change Vulnerability

We can use our current knowledge of the relationship between air and water temperature to develop stream-specific predictions for future water temperature. “Sensitivity” is a term used to describe how much a stream’s water temperature will change with a 1°C (1.8°F) change in air temperature. A stream with a higher sensitivity (>0.75) will increase faster as air temperatures increase in the years ahead. And we can use a salmon-relevant threshold value of 13°C (55°F) for average July temperature to describe a stream as “cold” or “warm” to create a framework for assessing climate change vulnerability:

- **Cold Temperature** - High Sensitivity
- **Warm Temperature** - High Sensitivity
- **Cold Temperature** - Low Sensitivity
- **Warm Temperature** - Low Sensitivity

Bodenburg Creek falls in the “cold, low sensitivity” category, which indicates that stream temperatures will likely remain favorable for salmon and this system will continue to provide important cold-water habitat in the decades ahead.

This baseline data set and our understanding of stream-specific sensitivity can guide future monitoring efforts to track climate change impacts and can help fisheries and land managers prioritize streams for research and protection efforts to ensure Cook Inlet wild salmon endure as thermal change continues.
