Salmon Stream Temperature Fact Sheet

**Why temperature?**

Water temperature affects all phases of the salmon lifecycle, including:

- timing of migration
- survivorship of eggs
- respiration
- metabolism
- availability of O\(_2\)

Warm water temperature induces stress in salmon and makes them more vulnerable to pollution, predation and disease.

**Meadow Creek**

Cook Inletkeeper coordinates a Stream Temperature Monitoring Network across key salmon-bearing systems of the Cook Inlet basin. Our goal is to describe water temperature profiles and identify watershed characteristics that make specific streams more sensitive to climate change impacts. This fact sheet provides a summary of data collected on Meadow Creek through this collaborative effort.

**Watershed facts**

The Meadow Creek watershed (highlighted in green on map) is located in the Mat-Su basin and flows into Big Lake.

- Watershed size: 42,004 acres
- Maximum elevation: 542 feet
- Mean elevation: 309 feet
- Percent wetlands: 16.6%
- Connected lakes: Yes

Meadow Creek Temperature Summary

Below is a summary of Meadow Creek water temperature data from 2008-2011.

- Maximum temperature recorded: 22.7°C (72.8°F)
- June average temperature: 13.9°C (57.1°F)
- July average temperature: 14.9°C (58.7°F)
- August average temperature: 13.0°C (55.4°F)
- Maximum 7-day average temperature: 16.4°C (61.5°F)
- Maximum 7-day maximum temperature: 19.0°C (66.2°F)
- # of days/year temperature exceeds 13°C (55°F): 71
- # of days/year temperature exceeds 15°C (59°F): 41

Climate Change Vulnerability

We can use our current knowledge of the relationship between air and water temperature to develop stream-specific predictions for future water temperature. “Sensitivity” is a term used to describe how much a stream’s water temperature will change with a 1°C (1.8°F) change in air temperature. A stream with a higher sensitivity (>0.75) will increase faster as air temperatures increase in the years ahead. And we can use a salmon-relevant threshold value of 13°C (55°F) for average July temperature to describe a stream as “cold” or “warm” to create a framework for assessing climate change vulnerability:

Meadow Creek falls in the "warm, high sensitivity" category, which indicates that July stream temperatures will likely increase by at least 2°C (3.6°F) in the decades ahead resulting in significant thermal stress for both spawning and juvenile salmon.

This baseline data set and our understanding of stream-specific sensitivity can guide future monitoring efforts to track climate change impacts and can help fisheries and land managers prioritize streams for research and protection efforts to ensure Cook Inlet wild salmon endure as thermal change continues.
